

Group Project II

1. Using python, load the dataset, ***Modeling_Customer_Churn_Module_V.***
2. Visualize the dataset (you could use univariate or bivariate approaches here).
3. Perform some exploratory analysis on the dataset and report on it.
4. Using the Customer ***Churn as your response variable***, what approaches would be suitable for your Predictive Analytics ?
5. Using the Customer ***Churn as your response variable***, build a predictive model for the dataset using Logistic Regression. (Hint, LogisticRegression is available within sklearn).
6. How suitable is the Logistic Regression model for the data compared to a Decision Trees model? (Hint: build a decision tree model and compare the accuracy from that to the accuracy from the Logistic regression model.)
