

Group Project

1. Using python, load the dataset, **EDA_Customer_Behavior_Module_IV.csv**
2. Compute basic summary statistics on the dataset that would help you better understand the data in order to analyze it.
3. What visualization approach would be suitable in visualizing **Purchase_Amount** in the dataset?
4. Use the approach identified in (3) above to visualize the **Purchase_Amount** feature.
5. What can you observe from the visualized **Purchase_Amount** variable?
6. Investigate the relationships that exist between the different features within the dataset.
7. Using a scatterplot, conduct a bivariate analysis into **Annual_Income** and **Spending_Score**.
8. Is there anything unique between **Annual_Income** and **Spending_Score** from the scatterplot?
9. In Ghana, it is believed that the average age a person can be before making an annual income of 85,000 Ghana Cedis is 43years based on the **EDA_Customer_Behavior_Module_IV.csv** dataset. As an analyst from Ace Global, if a sample of 50 people are taken from the population of 300 with a standard deviation of 15 and mean age of 40years, can you perform a hypothesis test to determine if the average age to make 85,000 Ghana Cedis is indeed 43years? Assume the data follows a normal distribution and the significance level is 5%.
